From a WhatsApp inquiry to an accountable quote

For Malaysian micro and small building-materials and hardware retailers.

Understand the request

Chinese, English and Malay inquiries can mix products, quantities, specifications and delivery details.

Connect the records

Catalog prices, stock, delivery rules and past orders are often checked across separate records.

Keep the owner in control

A useful recommendation still needs a person to verify the source and approve the final price.

EZQuote brings the quote chain together — without automatic customer sending or autonomous price approval.

From inquiry to an approved quotation

Review the inquiry

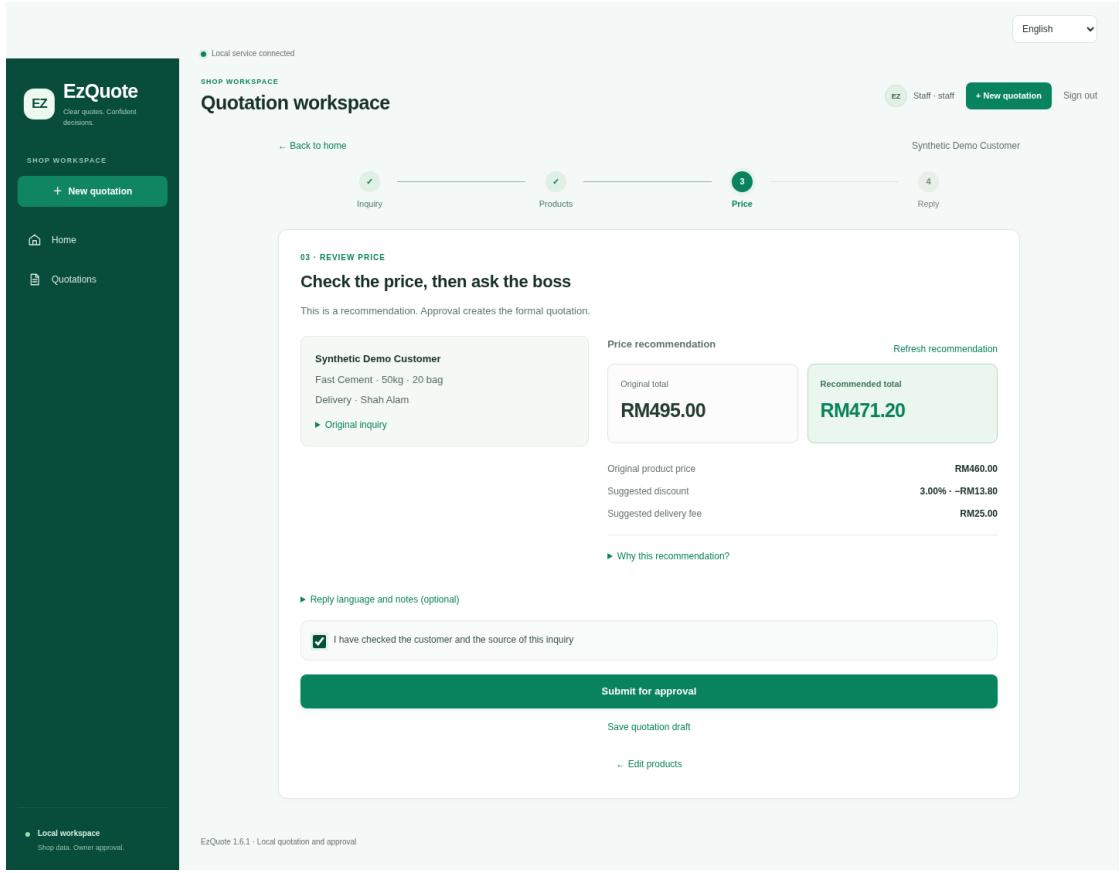

Check the source, matched items, quantities and delivery.

Use connected data

Import the store workbook; keep prices and stock checks deterministic.

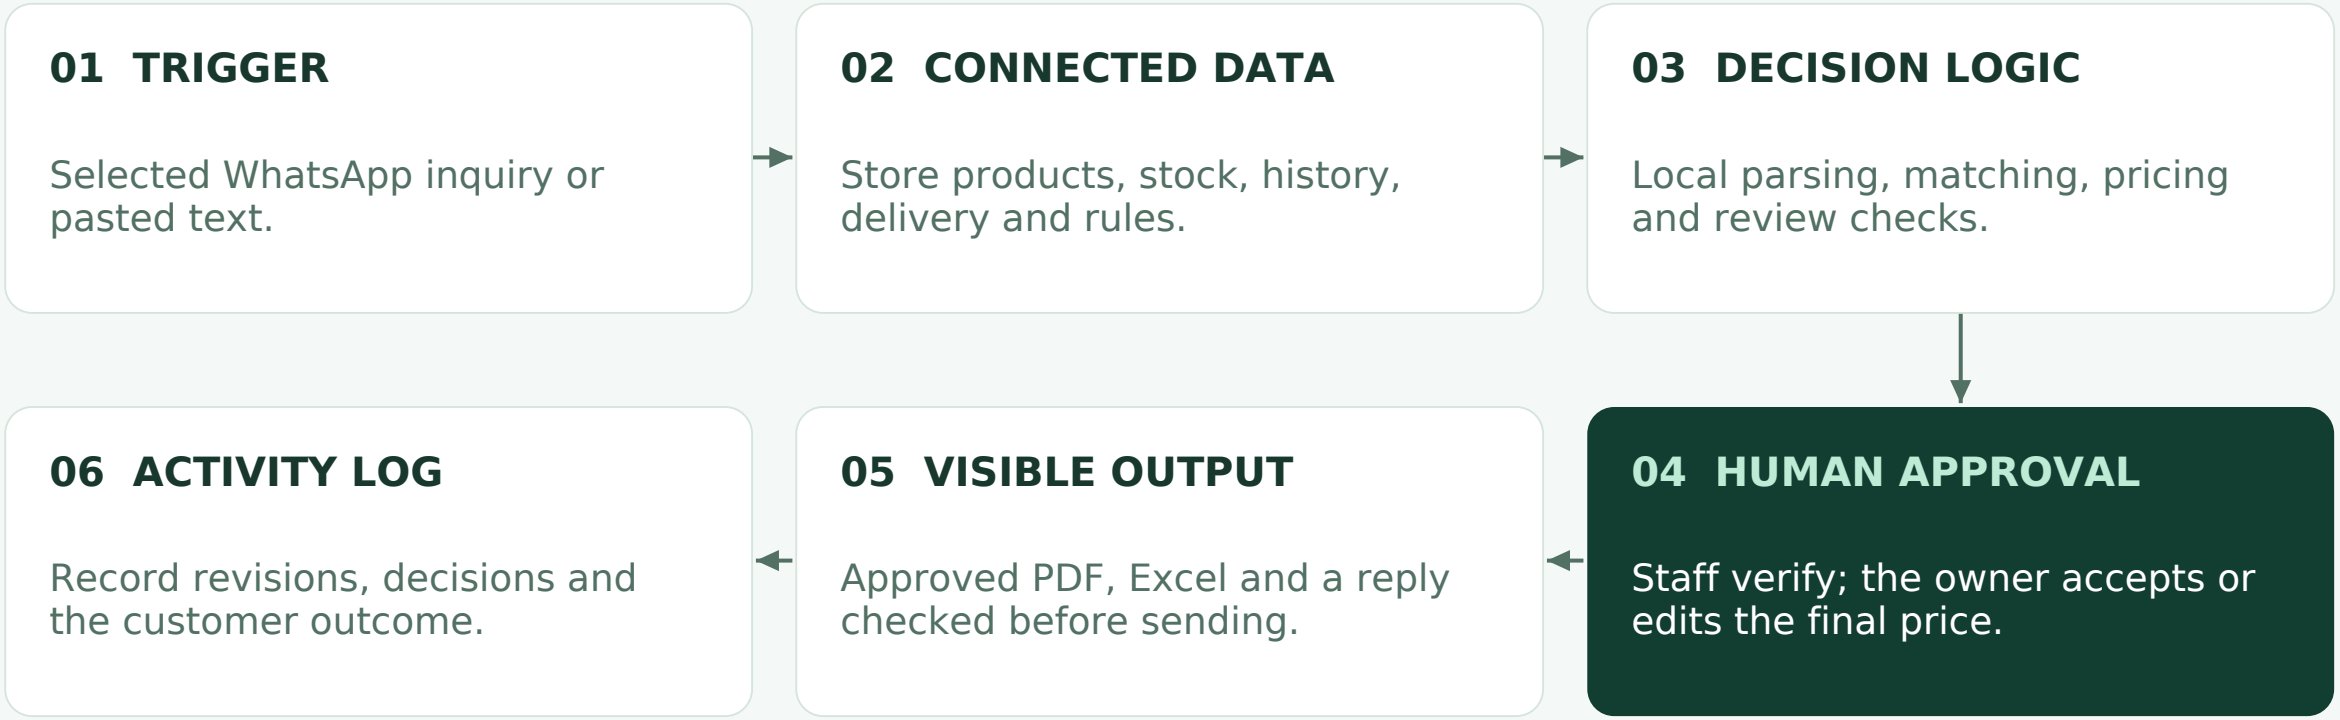

Approve and export

Owner approves. Staff prepare files and replies, then record the outcome.

Actual local interface with synthetic demonstration data.

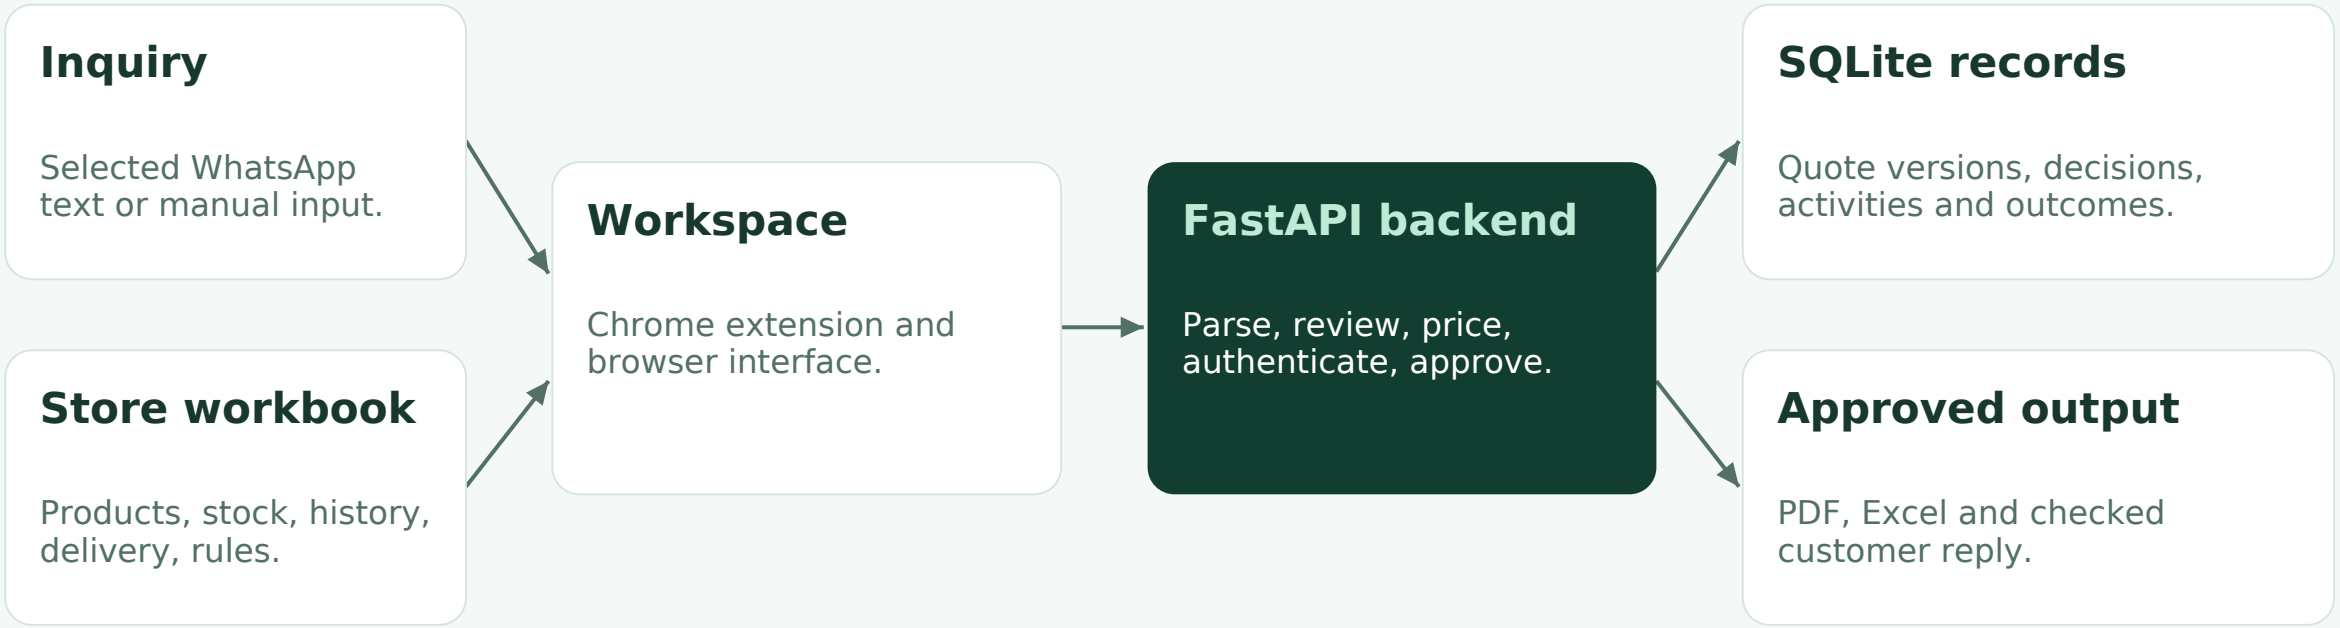

Human-in-the-loop by design

Recorded outcomes inform later suggestions. Owner approval is not a completed sale.

A local, auditable architecture

Deterministic prices, stock checks and final approval stay outside the language model.

Optional OpenAI structured extraction is implemented only for legacy catalog mode and is disabled by default. Qwen is not implemented.

One inquiry. Clear numbers. Owner approval.

20 bags of fast-setting cement, delivered to Shah Alam.

Original total

RM495.00

RM460.00 goods + RM35.00 delivery

Recommendation

RM471.20

RM460.00 − RM13.80 + RM25.00

Owner-edited approval

RM471.60

RM460.00 − RM18.40 + RM30.00

The owner changes the discount from 3% to 4% and sets delivery to RM30.

The approved PDF, Excel and customer replies use the final approved amount. Pricing suggestions remain traceable.

Fresh synthetic workbook: 20 × RM23.00; no payment or real customer transaction.

Engineering evidence and validation limits

Real local services and browser requests; synthetic data and provider responses.

What these checks exercise

Quantity integrity, multilingual rules, stock and pricing limits, permissions, review binding, approvals, exports, outcomes, mobile links, and opt-in hosting origins and account initialization.

Not yet verified: native WhatsApp integration, real API delivery, paid models, public hosting or clean Windows installation.

SDG alignment, grounded in the workflow

8.2

Productivity through technology

Organize inquiry review, business records and quotation preparation in one repeatable digital workflow.

8.3

Support micro and small firms

Keep human ownership of pricing while making records, decisions and customer outcomes easier to trace.

9.3

Connect small firms to markets

Consistent, documented quotations may support buyer and supplier relationships. No credit-access result is claimed.

This is qualitative alignment, not measured impact. No adoption, revenue, time-saving or environmental outcome is claimed.

SOURCE AND LOCAL DEMO

github.com/Dong-Wenhao/EZQuote

1. Install Python 3.10+
2. Run: python run.py
3. Load extension/ in Chrome
4. Import samples/business_demo.xlsx
5. Review, approve and export a quote

Code: Apache 2.0
Bundled font: SIL OFL 1.1

Submission access status

Local prototype

Validated with synthetic demonstration data.

Hosted prototype and video

Public URL and YouTube link awaiting verification.

Replit / RunPod

Usage is not verified; no proof is asserted.

Formal submission materials

Signed proposal supplied; phone/provider details still need review.
